8. **CSS Peek**- by Pranay Prakash

HTML

Hyper Text Markup Language

HTML is the code that is used to structure a web page and its content.

The component used to design the structure of websites are called [HTML tags](#)

First HTML File

index.html

It is the default name for a website's **Homepage**.

It is used by live server to open in the browser.

HTMLTag

A **container** for some content or other HTML tags

```
<P>This is a Paragraph</P>
```

Tag: <P> ... </P>

Content: This is a Paragraph

Html tag is parent of head & body tag

Head- Document Name

Body- Header, Main, Footer & Others

Boilerplate code or Boiler Code or just boilerplate are **sections of code that are repeated in multiple places with little to no variation.**

Example: just enter “!” and head “Enter”, the starting Boiler code will be there in your VS code.

All the needed basics are described below with basic webpage code:

```
<!DOCTYPE html>
<!-- DOCTYPE tells browser you are using HTML5 and html is a format-->
<html lang="en">
<!--html-> Root of an html document[Kitchen], lang is a =n attribute-->
<head>
  <!-- Head-> container for metadata -->
  <meta charset="UTF-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <!-- Viewpoint -> Makes website responsive to laptop, pc, iPod or
Samsung Phone screen. -->
  <title>Index [Home Page]</title> <!-- page title -->
</head> <!--This is body tag-->

<body> <!-- contains all data rendered by the browser -->
  <p>This is a paragraph</p> <!-- paragraph tag -->
  <p></p>
</body>
</html>
```

Comments in HTML

This is part of code that should not be parsed.

```
<!-- This is an HTML Comment -->
```

Make a line Comment-> [CTRL + /]

HTML is **NOT** case sensitive

<html> = <HTML>

<head> = <HEAD>

<body> = <BODY>

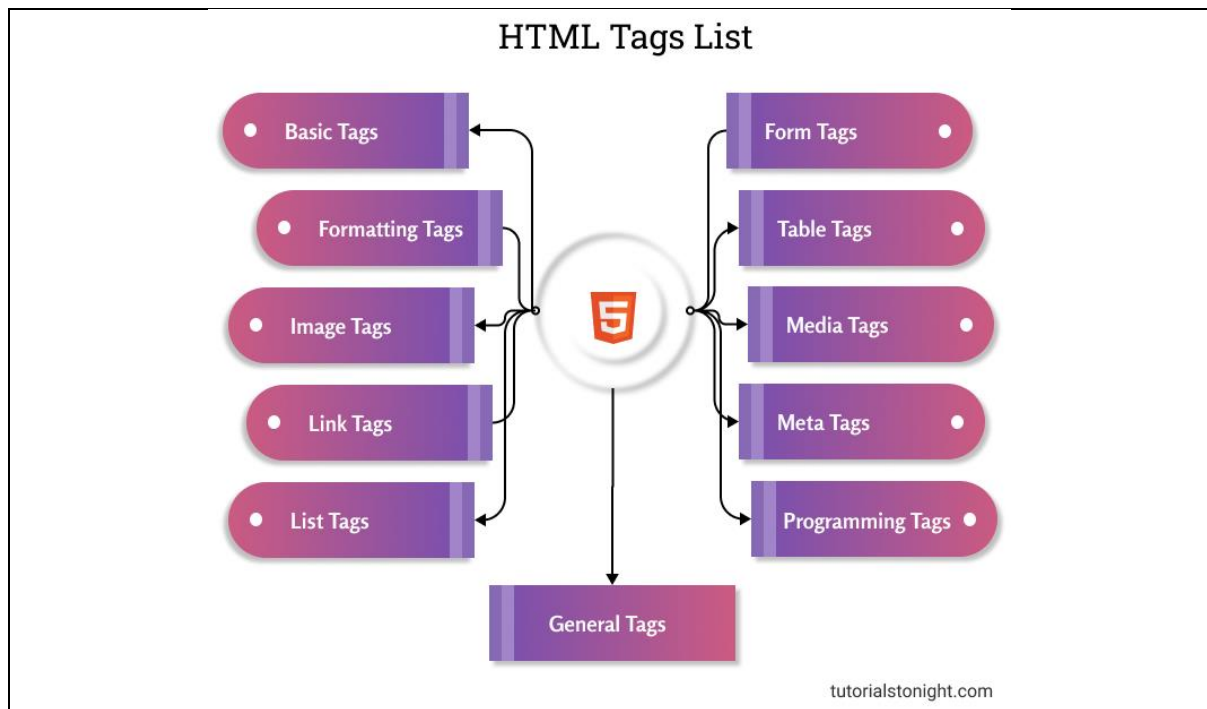

Level: 2

HTML Attributes

Attributes are used to add more information to the tag

<html lang="en">

Tags:

Br Tag- New Line

Used to add **next line** (line breaks) to your page

Used to display headings in HTML [Use headings for showing importance not for font size]

h1 (most important)

h2

h3

h4

h5

h6 (least important)

Paragraph Tag

Used to add paragraphs in HTML

`p> This is a sample paragraph </p>`

Anchor Tag

Used to add links to your page

` Google `

For New Tab

` Google `
target="_main" means the link will open in another Tab.

For Clickable Image

` `

Image Tag

- Use the HTML **** element to define an image
- Use the HTML **src** attribute to define the URL of the image
- Use the HTML **alt** attribute to define an alternate text for an image, if it cannot be displayed
- Use the HTML **width** and **height** attributes or the CSS **width** and **height** properties to define the size of the image
- Use the CSS **float** property to let the image float to the left or to the right
- Use **Height or Width** attribute but Do **NOT** use both.

Example: *Float attribute*

```

```

Used to add images to your page

```
img src="/image.png" alt="Random Image">
```

Here, alt creates **an alternative name** for users to understand what was about the image whenever there is an issue related to the links and Wi-Fi connection.

Extra:

Tag	Description
	Defines an image
<map>	Defines an image map
<area>	Defines a clickable area inside an image map
<picture>	Defines a container for multiple image resources

<Map> and <area>: *Defines clickable area into an image.*

<Picture>: *Shows different images for different screen sizes*

Background Image:

```
<p style="background-image: url(Paste the URL here);"> Write Text </p>
```

Bold,Italic&UnderlineTags

Used to highlight text in your page

```
<b> Bold </b>
```

```
<i> Italic </i>
```

```
<u> Underline </u>
```

Big & Small Tags

Used to display big & small text on your page

```
<big> Big </big>
```

```
<small> Small </small>
```

Hr Tag- Horizontal Line

Used to display a horizontal ruler, used to separate content

`<hr>` Horizontal Line

Subscript & Superscript Tag

Used to display a horizontal ruler, used to separate content

`_{subscript}`

H₂ O

`^{superscript}`

Aⁿ +B

Pre -Tag (Preformatted Text)

Used to display text as it is (without ignoring spaces & next line)

`<pre>`This

is a Sample Text

`</pre>`

Label: 3

Semantic Tags- Page Layout Techniques

Semantic Tags: These tags can be recognized by their names. Ex: Header= Header Tag
using Semantic tags for layout

<header>

<main>

Inside Main Tag

Section Tag

<section>

Article Tag

<article>

Aside Tag- Used for Ads | Developers keep <aside> for any Google advertisements. *This place is for Google Ads.*

<aside>

<footer>

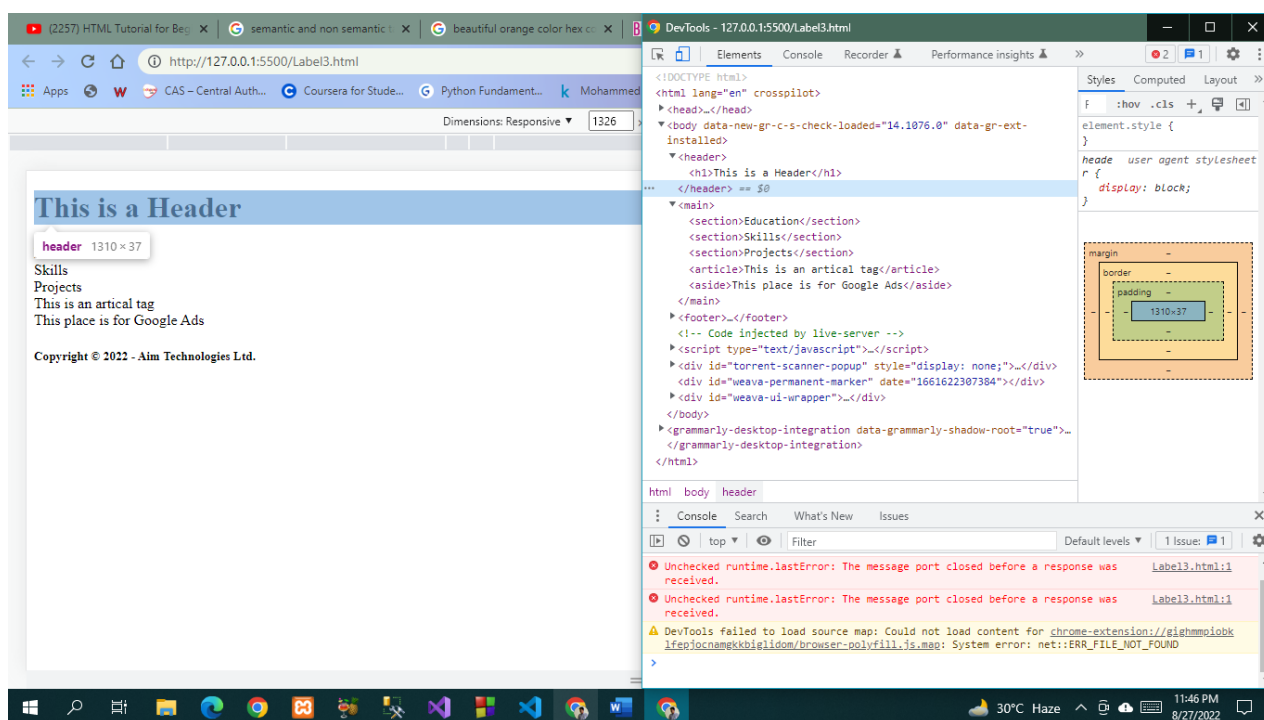

Figure: An example of Header, Main, Footer tag using Inspect

Nate: Maintaining Semantic tags is very important for **optimizing Search Engine Optimization (SEO)**

HTML Web Page Structure

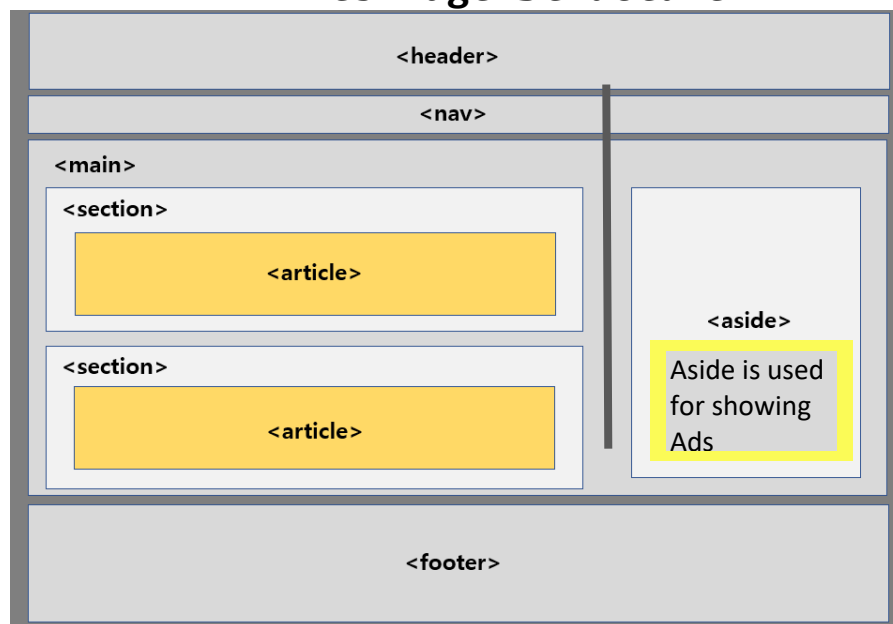

Fig.01: Inside Main Tag

1. Headers

SEMANTIC HTML I. Headers

<header>

`<header></header>`

Header of the webpage or an article. You can nest other elements inside this tag, such as subtitle, date or navigation.

<nav>

`<nav></nav>`

Navigation of the webpage. You can nest list and other elements inside.

<h1> - <h6>

`<h1></h1>`
`<h2></h2>`
`<h3></h3>`
`<h4></h4>`
`<h5></h5>`
`<h6></h6>`

Headers with different levels of importance (h1 - the main one, h6 - little ones). They create a hierarchy of content on the page. they create a kind of table of content of the webpage.

2. Main contents

SEMANTIC HTML II. Main content

<main>

```
<main></main>
```

The main content of a webpage. There should be only one <main> tag on the page - it's usually a container between a header/navigation and a footer.

<section>

```
<section></section>
```

A part of the site for a specific purpose. Designates an area of a page with a consistent content.

<article>

```
<article></article>
```

A complete, independent, and consistent part of the page, such as an article.

<aside>

```
<aside></aside>
```

Sidebar or call-out box with a content indirectly related to the website's main content.

<footer>

```
<footer></footer>
```

A footer usually contains info about the author, copyright data or links.

3. Others

SEMANTIC HTML III. Other

<time>

```
<time datetime="2020-06-24"></time>
```

Typically nested in <time> tag, provides a date (or date and time) of an article. It gets a [datetime] attribute with date in ISO-8601 format.

<figure>

```
<figure>
<img src="" alt="">
<figcaption>A very cool image.
</figcaption> </figure>
```

A tag for img, video or audio content. Can also contain a description.

<figcaption>

```
<figcaption></figcaption>
```

An accurate description of the provided object.

<address>

```
<address></address>
```

Provides a contact info: mailing address, phone numbers etc. Typically included in a <footer> tag.

Non-Semantic Tags

These tags are not recognized by their names such as **<P>** or **<div>** or **<a>**

Block Elements- Takes FULL width

<address>	<fieldset>	<nav> - Navigation Section
<article>	<figcaption>	<noscript>
<aside>	<figure>	 - Ordered List
<blockquote>	<footer>	<p> - Paragraph
<canvas>	<form>	<pre> - Preformatted Text
<dd>	<h1>-<h6>	<section>
<div>	<header>	<table>
<dl>	<hr>	<tfoot>
<dt>	 - List	 - Unordered List
<main>		

Div Tag

The **<div>** tag is a container and is a **Block Element (takes full width)** - which is then styled with CSS or manipulated with Java Script.

The **<div>** tag defines a division or a section in an HTML document.

The **<div>** tag is easily **styled** by using the **class** or **id** attribute.

Any sort of content can be put inside the **<div>** tag!

Note: By default, browsers always place a line break before and after the **<div>** element.

Inline Element- Takes width as per size

		<sub> - Subscript
<a> - Anchor Tag- Put Links		<sup> - Superscript
 - Works like Bold, but put Emphasis	
 - Break Line (New Line)	<script>

Span Tag

Span is also a container and is an Inline Element (takes width as per size)

The `` tag is an inline container used to mark up a part of a text, or a part of a document.

The `` tag is easily styled by CSS or manipulated with JavaScript using the class or id attribute.

The `` tag is much like the `<div>` element, but `<div>` is a block-level element and `` is an inline element.

BLOCK-LEVEL ELEMENTS:

INLINE ELEMENTS:

Figure: Differences between Block & Inline Elements

HTML Global Attributes

The global attributes are attributes that can be used with all HTML elements

<i>Attribute</i>	<i>Description</i>
<u>accesskey</u>	Specifies a shortcut key to activate/focus an element
<u>class</u>	Specifies one or more class names for an element (refers to a class in a style sheet)
<u>contenteditable</u>	Specifies whether the content of an element is editable or not
<u>data-*</u>	Used to store custom data private to the page or application
<u>dir</u>	Specifies the text direction for the content in an element
<u>draggable</u>	Specifies whether an element is draggable or not
<u>hidden</u>	Specifies that an element is not yet, or is no longer, relevant
<u>id</u>	Specifies a unique id for an element
<u>lang</u>	Specifies the language of the element's content
<u>spellcheck</u>	Specifies whether the element is to have its spelling and grammar checked or not
<u>style</u>	Specifies an inline CSS style for an element
<u>tabindex</u>	Specifies the tabbing order of an element
<u>title</u>	Specifies extra information about an element
<u>translate</u>	Specifies whether the content of an element should be translated or not

Level: Pro

Lists In HTML

1. Ordered List
2. Unordered List- Used most often.
3. Definition List

Codes	Output
<pre> Apple Red Apple Green Apple Mango Red Mango Green Mango Lichi Ripe lichi Green Lichi </pre>	<ul style="list-style-type: none"> • Apple <ul style="list-style-type: none"> ◦ Red Apple ◦ Green Apple • Mango <ul style="list-style-type: none"> ◦ Red Mango ◦ Green Mango • Lichi <ul style="list-style-type: none"> ◦ Ripe lichi ◦ Green Lichi
<i>Figure: Unordered List</i>	
<pre> Apple Red Apple Green Apple Mango Red Mango Green Mango Lichi Ripe lichi Green Lichi </pre>	<ol style="list-style-type: none"> 1. Apple <ol style="list-style-type: none"> 1. Red Apple 2. Green Apple 2. Mango <ol style="list-style-type: none"> 1. Red Mango 2. Green Mango 3. Lichi <ol style="list-style-type: none"> 1. Ripe lichi 2. Green Lichi
<i>Figure: Ordered List</i>	

Description List

Here,

dl = Description list,
dt = Description Term element,
dd = Description Details element

```
<dl>
  <dt>Introduction</dt>
  <dd>Here, I used Descriptive List. Here, dl = Description list, dt =
Description Term element, dd = Description Details element </dd>
</dl>
```

Introduction

Here, I used Descriptive List. Here, dl = Description list, dt = Description Term element, dd = Description Details element

Tables in HTML

```
<table>
  <caption>HTML TAGS</caption>
  <th>Semantic Tags</th>
  <th>Non-Semantic Tags</th>
  <tr>
    <td>Header tag</td>
    <td>img tag</td>
  </tr>
  <tr>
    <td>Main tag</td>
    <td>Paragraph tag</td>
  </tr>
  <tr>
    <td>Footer tag</td>
    <td>H1 tag</td>
  </tr>
</table>
```

Figure: Code for Table-> Caption, Table Head, Table Row & Table Data.

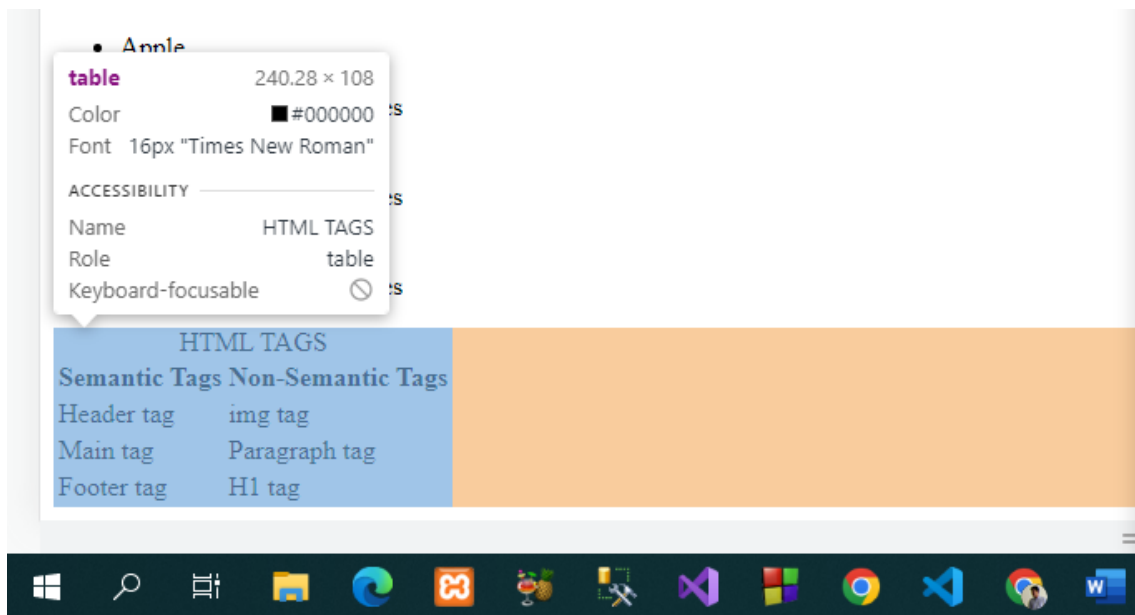

Figure: Inspect of the above code

Captions in Tables

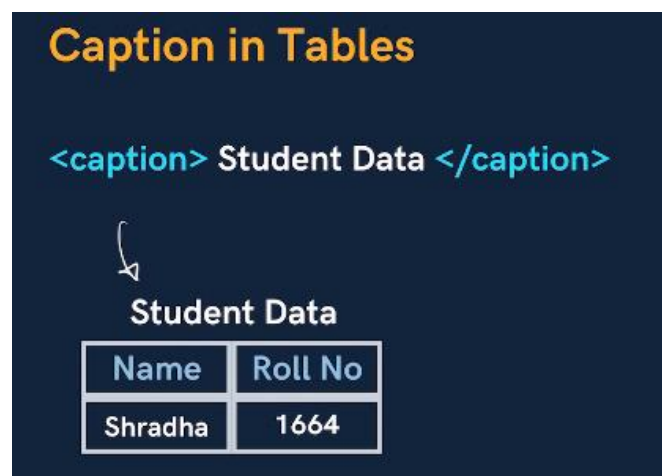

Figure: Caption in Table

Thead & tbody in Tables

<thead> to wrap table head

<tbody> to wrap table body

Colspan Attribute- Cells/Column Merging technique

colspan="n" Span= Merge in excel

used to create cells/columns which spans/merge over multiple columns

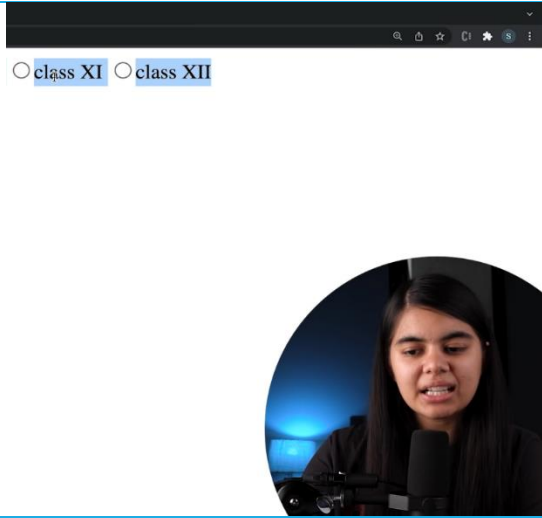

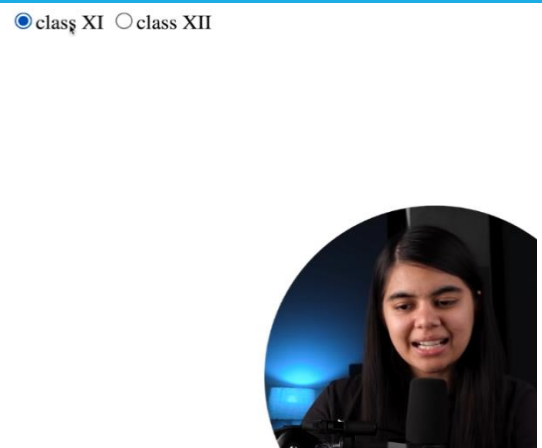

Form in HTML

1. Use **<label>** for Text
2. Use **<input>** for getting input like **Name (Text), Password, Email, Telephone no (tel), Date, Radio, Check box, File, Range, Submit, URL**, etc. Mentioned are the input types.

Code	Output
<pre> <form action=""> <p>Name: </p> <input type="text" name="name" placeholder="Enter your Name"> <P>Password</p> <input type="password" name="pass" placeholder="Enter Password"> <p>What is the capital of Bangladesh? </p> <label for="101"><input type="radio" name="capital" class="country" id="101" value="Dhaka">Dhaka</label> <label for="102"><input type="radio" name="capital" clas="country" id="102" value="Chittagong">Chittagong</label> <input type="radio" name="capital" class="country" value="Khulna">Khulna <input type="radio" name="capital" clas="country" value="Noakhali">Noakhali

 <!-- br * 5 --> <label for="tac"> <input id="tac" type="checkbox" name="terms- and-conditions"> I agree to the Terms and Conditions </label> <p> Read our Terms and Conditions </p> </form> </pre>	<p>Name:</p> <input type="text" value="Enter your Name"/> <p>Password</p> <input type="password" value="Enter Password"/> <p>What is the capital of Bangladesh?</p> <p> <input checked="" type="radio"/> Dhaka <input type="radio"/> Chittagong <input type="radio"/> Khulna <input type="radio"/> Noakhali </p> <p><input checked="" type="checkbox"/> I agree to the Terms and Conditions</p> <p>Read our Terms and Conditions</p>  <p>Look at the radio buttons:</p> <p>For Dhaka and Chittagong, the texts are clickable (because we used Label for both of these) and when you click on the text the radio button is selected.</p> <p>On the other hand, for the Khulna and Noakhali, the texts are not clickable and only when you click on the round shape radio button the button is selected.</p>

Uses of Label in Radio button within Label:

Code	Output
<pre><form action="/action.php"> <input type="text" placeholder="username"> <input type="password" placeholder="password"> <input type="radio" value="class XI" name="class">class XI <input type="radio" value="class XII" name="class">class XII </form></pre> <p>Look at the output of the code: The radio buttons(text) are not clickable on text because there is not used Label.</p>	
<pre><label for="101"> <input type="radio" value="class XI" name="class" id="101">class XI </label> <label for="102"> <input type="radio" value="class XII" name="class" id="102">class XII </label> </form></pre> <p>Look at the output of the code: The radio buttons(text) are clickable on text because of the usage of Label.</p>	

Class & Id

Id: 01 Student-01	Id: 02 Student-02	Id: 03 Student-03
Id: 04 Student-04	Id: 05 Student-05	Id: 06 Student-06

Class: 7 & this class has 6 students. For each student there is assigned an ID.

Class is general item used for 2+ elements but the Id is a unique item here.

Check box

Code	Output
<pre> <h4>Select an optional Subject</h4> <label for="Math"> <input type="checkbox" name="Math" id="S101">Math(S101) </label> <label for="Physics"> <input type="checkbox" name="Physics" id="S102">Physics(S102) </label> <label for="Chemistry"> <input type="checkbox" name="Chemistry" id="S103">Chemistry(S103) </label> <label for="Biology"> <input type="checkbox" name="Biology" id="S104">Biology(S104) </label> </pre>	<p>Select an optional Subject</p> <p><input type="checkbox"/> Math(S101) <input type="checkbox"/> Physics(S102) <input type="checkbox"/> Chemistry(S103) <input type="checkbox"/> Biology(S104)</p> 

Text area

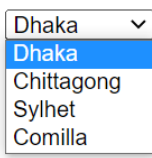

Generally, used for Feedback like a big text box.

```

<textarea name="Feedback" id="Feedback_01" rows="10" placeholder="Please give
your feedback">
</textarea>

```

Select

Code	Output
<pre> <h4>Where do you live?</h4> <select name="City" id="City"> <option value="Dhaka">Dhaka</option> <option value="Chittagong">Chittagong</option> <option value="Sylhet">Sylhet</option> <option value="Comilla">Comilla</option> </select> </pre>	<p>Where do you live?</p> 

iframe Tag

1. First go to YouTube Video Link: <https://www.youtube.com/watch?v=HcOc7P5BMi4&t=6557s>
2. Then go to share option
3. Click on Embed and you will find the iframe (Embed Link) generated by YouTube/google.

Code:

```
<iframe width="560" height="315"
src="https://www.youtube.com/embed/HcOc7P5BMi4" title="YouTube video player"
frameborder="0" allow="accelerometer; autoplay; clipboard-write; encrypted-
media; gyroscope; picture-in-picture" allowfullscreen></iframe>
```

From YouTube (Allowed by video owner)

Code for Google.com

```
<iframe src="https://www.google.com/" frameborder="0"></iframe>
```

Google.com is not allowed anywhere

Video Tag

Attributes:

-  **Controls:** Gives the user to control the Play/Pause, Full Screen & Download.
-  **loop:** If the video is played once then play again automatically.
-  **Autoplay:** Whenever the website is open Autoplay happens (Do not use this or in case you have to use this, mute the sound).
-  height
-  width

Quotes vs Block Quotes

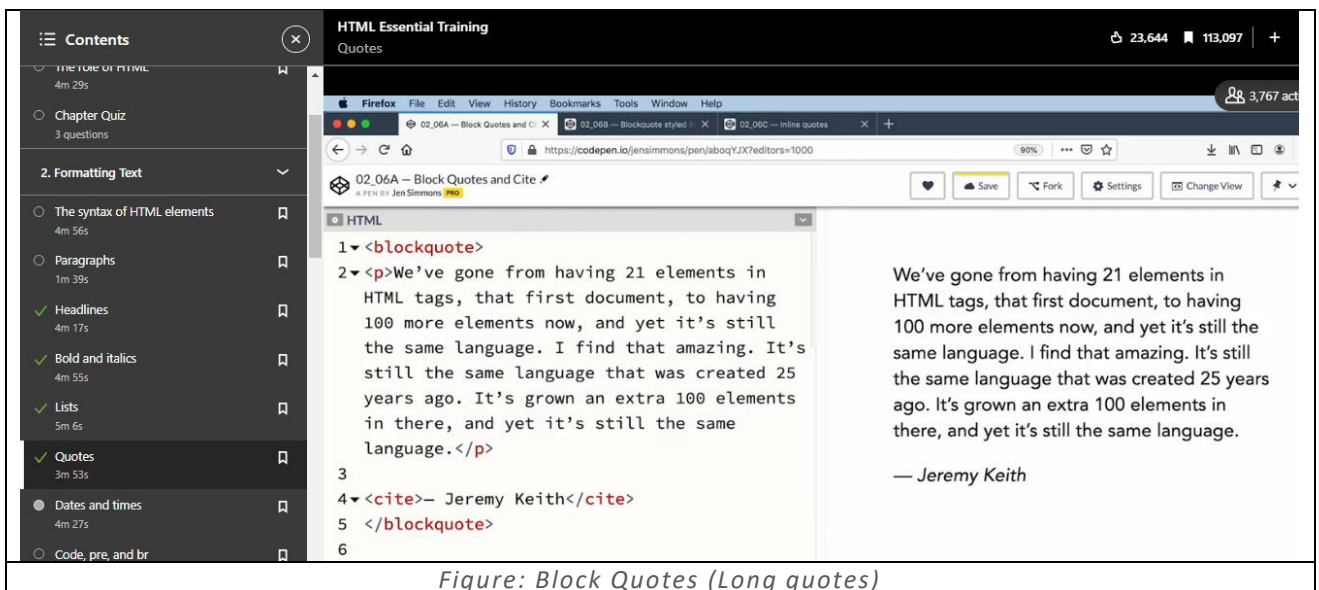

Figure: Block Quotes (Long quotes)

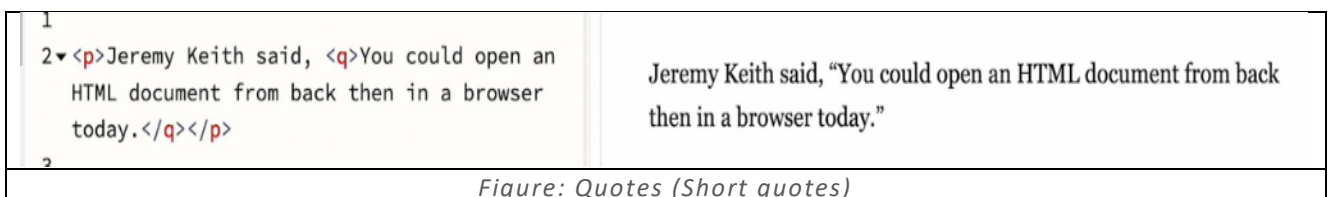

Figure: Quotes (Short quotes)

HTML Attribute- Language and Direction

Here, `lang="en-GB"` means Great Britain English Language
`Lang="fr"` means French Language
`dir="ltr"` means Left To Right Direction
`dir="rtl"` means Right To Left Direction

Weird Characters

```
<p>Hi, this is &lt; p &gt; tag </p>
```

Here,

< is an HTML Entity which can be used within text. < means Less Than.

> means Greater Than.

Entity	Character	Entity	Character
<	<	©	©
>	>	™	™
&	&	☆	☆

Figure: These are some of the HTML Entities

Another Important HTML Entity is Non Breaking Space- ** **

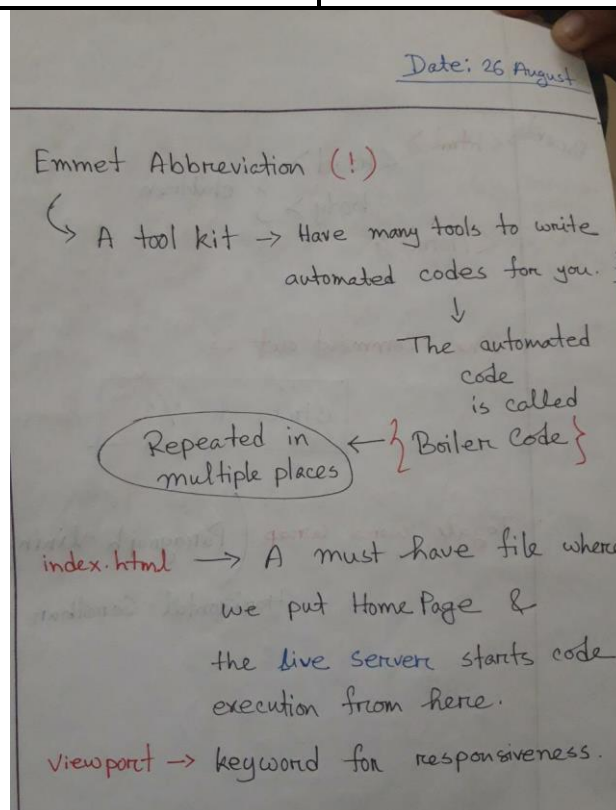

** ** is used when 2 words or 2 parts of a person's name must always stick together.

Shortcuts:

- Open Command Palette: **CTRL + SHIFT + P**
- A Line Comment out: **CTRL + /**
- [Wrapping Text] Using a tag for selected text by Command Palette:
Select text + Open Command Palette [CTRL + SHIFT + P] + Type: Wrap with Abbreviation -> then type Bold/Italic/P etc.
- Show big Paragraph in multiple lines:
Select text + Open Command Palette [CTRL + SHIFT + P] + Type: Toggle Word Wrap

Type these Keyword	See the Magic
input:text	<code><input type="text" name="" id=""></code>
br*5	<code>

</code>
h1.class_01	<code><h1 class="class_01"></h1></code>
